Research activity description: Two months have passed since the World Health Organization (WHO) declared the pandemic of the Coronavirus Disease 19 (COVID-19), caused by the SARS CoV-2 virus, on March 11, 2020. Medical and healthcare workers have continued to be on the frontline to defeat this disease, however, continual changes are being made to their working habits which are proving to be difficult. Although the skin is not the main target of the SARS CoV-2 infection, it is strongly involved both directly and indirectly, in many aspects of dermatological disease management, and particularly in pediatric dermatology. In this manuscript, our goal was to provide a "up-to-date" account on this topic, through analysis of current literature and sharing our experiences during this pandemic.
